

ABSTRACT OF THE DISCLOSURE

A system for exchange of data between a plurality of clients and at least one back end data store by using a central synchronization server having a connection to the clients. The clients generate data to be synchronized. The system includes a sync engine connected to the central synchronization server for performing synchronization with the central synchronization server, a single back end neutral interface associated with and connected to the sync engine, and a component assigned to each of the at least one back end data store. Each of the components include a back end dependent part having an interface with the single back end neutral interface and an interface with the assigned back end data store.
